Instructions to Set-Up GitHub and Fork a Repository

1. Navigate to the GitHub home and create an account.
2. Navigate to the repository you would like to fork.
    a. In the top right, click “Fork” and title your repository and add a description
    b. Keep “copy the main branch only” selected (?)
    c. Click “create fork”
3. Get the files from the original repository onto your computer
    a. Navigate to your fork and click the red “Code” button, then under HTTPS click the copy link button
    b. Create a new folder on your computer to hold the repository files (mine is titled “RAwork”)
    c. Open your computer’s terminal and type cd ~/Desktop/RAwork
        i. Type “git clone” then add the link you copied from the fork and hit enter
4. Get your fork to be able to sync with the upstream repository
    a. Go to the original repository and copy link the same way you did for the fork
    b. Go back to your terminal and again type cd ~/Desktop/RAwork
    c. Then write “Git remote -v”
    d. Then write “git remote add upstream” then paste your link
        i. Can type “Git remote -v” again to verify
